

Limits**Definitions**

Precise Definition : We say $\lim_{x \rightarrow a} f(x) = L$ if for every $\varepsilon > 0$ there is a $\delta > 0$ such that whenever $0 < |x - a| < \delta$ then $|\ f(x) - L \ | < \varepsilon$.

can make $f(x)$ as close to L as we want by taking x large enough and positive.

“Working” Definition : We say $\lim_{x \rightarrow a} f(x) = L$ if we can make $f(x)$ as close to L as we want by taking x sufficiently close to a (on either side of a) without letting $x = a$.

There is a similar definition for $\lim_{x \rightarrow -\infty} f(x) = L$ except we require x large and negative.

Right hand limit : $\lim_{x \rightarrow a^+} f(x) = L$. This has the same definition as the limit except it requires $x > a$.

can make $f(x)$ arbitrarily large (and positive) by taking x sufficiently close to a (on either side of a) without letting $x = a$.

Left hand limit : $\lim_{x \rightarrow a^-} f(x) = L$. This has the same definition as the limit except it requires $x < a$.

There is a similar definition for $\lim_{x \rightarrow -\infty} f(x) = -\infty$ except we make $f(x)$ arbitrarily large and negative.

Relationship between the limit and one-sided limits

$$\lim_{x \rightarrow a} f(x) = L \Rightarrow \lim_{x \rightarrow a^+} f(x) = \lim_{x \rightarrow a^-} f(x) = L$$

$$\lim_{x \rightarrow a} f(x) \neq \lim_{x \rightarrow a^+} f(x) \Rightarrow \lim_{x \rightarrow a} f(x) \text{ Does Not Exist}$$

Properties

Assume $\lim_{x \rightarrow a} f(x)$ and $\lim_{x \rightarrow a} g(x)$ both exist and c is any number then,

$$1. \lim_{x \rightarrow a} [cf(x)] = c \lim_{x \rightarrow a} f(x)$$

$$4. \lim_{x \rightarrow a} \left[\frac{f(x)}{g(x)} \right] = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)} \text{ provided } \lim_{x \rightarrow a} g(x) \neq 0$$

$$2. \lim_{x \rightarrow a} [f(x) \pm g(x)] = \lim_{x \rightarrow a} f(x) \pm \lim_{x \rightarrow a} g(x)$$

$$5. \lim_{x \rightarrow a} [f(x)]^n = \left[\lim_{x \rightarrow a} f(x) \right]^n$$

$$3. \lim_{x \rightarrow a} [f(x)g(x)] = \lim_{x \rightarrow a} f(x) \lim_{x \rightarrow a} g(x)$$

$$6. \lim_{x \rightarrow a} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x \rightarrow a} f(x)}$$

Basic Limit Evaluations at $\pm \infty$

Note : $\text{sgn}(a) = 1$ if $a > 0$ and $\text{sgn}(a) = -1$ if $a < 0$.

$$1. \lim_{x \rightarrow \pm\infty} e^x = \infty \quad \& \quad \lim_{x \rightarrow \mp\infty} e^x = 0$$

$$2. \lim_{x \rightarrow \pm\infty} \ln(x) = \infty \quad \& \quad \lim_{x \rightarrow -\infty} \ln(x) = -\infty$$

$$3. \text{ If } r > 0 \text{ then } \lim_{x \rightarrow \pm\infty} \frac{b}{x^r} = 0$$

4. If $r > 0$ and x^r is real for negative x then $\lim_{x \rightarrow -\infty} \frac{b}{x^r} = 0$

$$5. n \text{ even : } \lim_{x \rightarrow \pm\infty} x^n = \infty$$

$$6. n \text{ odd : } \lim_{x \rightarrow \pm\infty} x^n = \infty \quad \& \quad \lim_{x \rightarrow -\infty} x^n = -\infty$$

$$7. n \text{ even : } \lim_{x \rightarrow \pm\infty} a x^n + \dots + b x + c = \text{sgn}(a) \infty$$

$$8. n \text{ odd : } \lim_{x \rightarrow \pm\infty} a x^n + \dots + b x + c = \text{sgn}(a) \infty$$

$$9. n \text{ odd : } \lim_{x \rightarrow -\infty} a x^n + \dots + c x + d = -\text{sgn}(a) \infty$$

Evaluation Techniques**Continuous Functions**

If $f(x)$ is continuous at a then $\lim_{x \rightarrow a} f(x) = f(a)$

Continuous Functions and Composition
 $f(x)$ is continuous at b and $\lim_{x \rightarrow a} g(x) = b$ then

$$\lim_{x \rightarrow a} f(g(x)) = f(\lim_{x \rightarrow a} g(x)) = f(b)$$

Factor and Cancel

$$\lim_{x \rightarrow 2} \frac{x^2 + 4x - 12}{x^2 - 2x} = \lim_{x \rightarrow 2} \frac{(x-2)(x+6)}{x(x-2)}$$

$$= \lim_{x \rightarrow 2} \frac{x+6}{x} = \frac{8}{2} = 4$$

Rationalize Numerator/Denominator

$$\lim_{x \rightarrow 9} \frac{3 - \sqrt{x}}{x^2 - 81} = \lim_{x \rightarrow 9} \frac{3 - \sqrt{x}}{x - 9} \cdot \frac{3 + \sqrt{x}}{3 + \sqrt{x}}$$

$$= \lim_{x \rightarrow 9} \frac{9 - x}{(x^2 - 81)(3 + \sqrt{x})} = \lim_{x \rightarrow 9} \frac{-1}{(x-9)(3 + \sqrt{x})} = \frac{-1}{(18)(6)} = -\frac{1}{108}$$

Combine Rational Expressions

$$\lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{1}{x+h} - \frac{1}{x} \right) = \lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{x - (x+h)}{x(x+h)} \right)$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \left(\frac{-h}{x(x+h)} \right) = \lim_{h \rightarrow 0} \frac{-1}{x(x+h)} = -\frac{1}{x^2}$$

Some Continuous Functions

Partial list of continuous functions and the values of x for which they are continuous.

1. Polynomials for all x .
2. Rational function, except for x 's that give division by zero.
3. \sqrt{x} (n odd) for all x .
4. $\sqrt[n]{x}$ (n even) for all $x \geq 0$.
5. e^x for all x .
6. $\ln x$ for $x > 0$.
7. $\cos(x)$ and $\sin(x)$ for all x .
8. $\tan(x)$ and $\sec(x)$ provided $x \neq \dots, -\frac{3\pi}{2}, -\frac{\pi}{2}, \frac{\pi}{2}, \frac{3\pi}{2}, \dots$
9. $\cot(x)$ and $\csc(x)$ provided $x \neq \dots, -2\pi, -\pi, 0, \pi, 2\pi, \dots$

Intermediate Value Theorem

Suppose that $f(x)$ is continuous on $[a, b]$ and let M be any number between $f(a)$ and $f(b)$.

Then there exists a number c such that $a < c < b$ and $f(c) = M$.

L'Hospital's Rule

If $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = 0$ or $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{\pm\infty}{\pm\infty}$ then,

$$\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \lim_{x \rightarrow a} \frac{f'(x)}{g'(x)} \quad a \text{ is a number, } \infty \text{ or } -\infty$$

Polynomials at Infinity

$p(x)$ and $q(x)$ are polynomials. To compute

$\lim_{x \rightarrow \pm\infty} \frac{p(x)}{q(x)}$ factor largest power of x in $q(x)$ out of both $p(x)$ and $q(x)$ then compute limit.

$$\lim_{x \rightarrow \infty} \frac{3x^2 - 4}{5x - 2x^2} = \lim_{x \rightarrow \infty} \frac{x^2 \left(\frac{3-4}{x^2} \right)}{x^2 \left(\frac{5}{x} - 2 \right)} = \lim_{x \rightarrow \infty} \frac{3 - \frac{4}{x^2}}{\frac{5}{x} - 2} = -\frac{3}{2}$$

Piecewise Function

$$\lim_{x \rightarrow 2} g(x) \text{ where } g(x) = \begin{cases} x^2 + 5 & \text{if } x < -2 \\ 1 - 3x & \text{if } x \geq -2 \end{cases}$$

Compute two one sided limits.

$$\lim_{x \rightarrow 2^-} g(x) = \lim_{x \rightarrow 2^-} x^2 + 5 = 9$$

$$\lim_{x \rightarrow 2^+} g(x) = \lim_{x \rightarrow 2^+} 1 - 3x = 7$$

One sided limits are different so $\lim_{x \rightarrow 2} g(x)$ doesn't exist. If the two one sided limits had

been equal then $\lim_{x \rightarrow 2} g(x)$ would have existed and had the same value.

Derivatives**Definition and Notation**

If $y = f(x)$ then the derivative is defined to be $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$.

If $y = f(x)$ then all of the following are equivalent notations for the derivative.

$$f'(x) = y' = \frac{df}{dx} = \frac{dy}{dx} = \frac{d}{dx}(f(x)) = Df(x)$$

$$f'(a) = y'|_{x=a} = \frac{df}{dx}\bigg|_{x=a} = \frac{dy}{dx}\bigg|_{x=a} = Df(a)$$

Interpretation of the Derivative

- If $y = f(x)$ then,
- $m = f'(a)$ is the slope of the tangent line to $y = f(x)$ at $x = a$ and the equation of the tangent line at $x = a$ is given by $y = f(a) + f'(a)(x - a)$.
 - $f'(a)$ is the instantaneous rate of change of $f(x)$ at $x = a$.
 - If $f(x)$ is the position of an object at time x then $f'(a)$ is the velocity of the object at $x = a$.

Basic Properties and Formulas

If $f(x)$ and $g(x)$ are differentiable functions (the derivative exists), c and n are any real numbers,

- $(cf)' = c f'(x)$
- $(f \pm g)' = f'(x) \pm g'(x)$
- $(fg)' = f'g + fg'$ – **Product Rule**
- $\left(\frac{f}{g}\right)' = \frac{f'g - fg'}{g^2}$ – **Quotient Rule**
- $\frac{d}{dx}(c) = 0$
- $\frac{d}{dx}(x^n) = nx^{n-1}$ – **Power Rule**
- $\frac{d}{dx}(f(g(x))) = f'(g(x))g'(x)$
This is the **Chain Rule**

Common Derivatives

$\frac{d}{dx}(x) = 1$	$\frac{d}{dx}(\csc x) = -\csc x \cot x$	$\frac{d}{dx}(a^x) = a^x \ln(a)$
$\frac{d}{dx}(\sin x) = \cos x$	$\frac{d}{dx}(\cot x) = -\csc^2 x$	$\frac{d}{dx}(e^x) = e^x$
$\frac{d}{dx}(\cos x) = -\sin x$	$\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}$	$\frac{d}{dx}(\ln x) = \frac{1}{x}, x > 0$
$\frac{d}{dx}(\tan x) = \sec^2 x$	$\frac{d}{dx}(\cos^{-1} x) = -\frac{1}{\sqrt{1-x^2}}$	$\frac{d}{dx}(\ln x) = \frac{1}{x}, x \neq 0$
$\frac{d}{dx}(\sec x) = \sec x \tan x$	$\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$	$\frac{d}{dx}(\log_a(x)) = \frac{1}{x \ln a}, x > 0$

Chain Rule Variants

The chain rule applied to some specific functions.

- $\frac{d}{dx}([f(x)]^n) = n[f(x)]^{n-1} f'(x)$
- $\frac{d}{dx}(e^{f(x)}) = f'(x)e^{f(x)}$
- $\frac{d}{dx}(\ln[f(x)]) = \frac{f'(x)}{f(x)}$
- $\frac{d}{dx}(\sin[f(x)]) = f'(x) \cos[f(x)]$
- $\frac{d}{dx}(\cos[f(x)]) = -f'(x) \sin[f(x)]$
- $\frac{d}{dx}(\tan[f(x)]) = f'(x) \sec^2[f(x)]$
- $\frac{d}{dx}(\sec[f(x)]) = f'(x) \sec[f(x)] \tan[f(x)]$
- $\frac{d}{dx}(\tan^{-1}[f(x)]) = \frac{f'(x)}{1 + [f(x)]^2}$

Higher Order Derivatives

The Second Derivative is denoted as

$$f''(x) = f^{(2)}(x) = \frac{d^2 f}{dx^2} \text{ and is defined as}$$

$f''(x) = (f'(x))'$, i.e. the derivative of the first derivative, $f'(x)$.

The n^{th} Derivative is denoted as

$$f^{(n)}(x) = \frac{d^n f}{dx^n} \text{ and is defined as}$$

$f^{(n)}(x) = (f^{(n-1)}(x))'$, i.e. the derivative of the $(n-1)^{\text{st}}$ derivative, $f^{(n-1)}(x)$.

Implicit Differentiation

Find y' if $e^{2x-9y} + x^3 y^2 = \sin(y) + 11x$. Remember $y = y(x)$ here, so products/quotients of x and y will use the product/quotient rule and derivatives of y will use the chain rule. The "trick" is to differentiate as normal and every time you differentiate a y you tack on a y' (from the chain rule). After differentiating solve for y' .

$$\begin{aligned} e^{2x-9y} (2 - 9y') + 3x^2 y^2 + 2x^3 y y' &= \cos(y) y' + 11 \\ 2e^{2x-9y} - 9y' e^{2x-9y} + 3x^2 y^2 + 2x^3 y y' &= \cos(y) y' + 11 \\ (2x^3 y - 9e^{2x-9y} - \cos(y)) y' &= 11 - 2e^{2x-9y} - 3x^2 y^2 \\ y' &= \frac{11 - 2e^{2x-9y} - 3x^2 y^2}{2x^3 y - 9e^{2x-9y} - \cos(y)} \end{aligned}$$

Increasing/Decreasing – Concave Up/Concave Down**Critical Points**

$x = c$ is a critical point of $f(x)$ provided either

- $f'(c) = 0$ or 2. $f'(c)$ doesn't exist.

Concave Up/Concave Down

- If $f''(x) > 0$ for all x in an interval I then $f(x)$ is concave up on the interval I .
- If $f''(x) < 0$ for all x in an interval I then $f(x)$ is concave down on the interval I .

Increasing/Decreasing

- If $f'(x) > 0$ for all x in an interval I then $f(x)$ is increasing on the interval I .
- If $f'(x) < 0$ for all x in an interval I then $f(x)$ is decreasing on the interval I .
- If $f'(x) = 0$ for all x in an interval I then $f(x)$ is constant on the interval I .

Inflection Points

$x = c$ is a inflection point of $f(x)$ if the concavity changes at $x = c$.

Absolute Extrema

- $x = c$ is an absolute maximum of $f(x)$ if $f(c) \geq f(x)$ for all x in the domain.
- $x = c$ is an absolute minimum of $f(x)$ if $f(c) \leq f(x)$ for all x in the domain.

Fermat's Theorem *

If $f(x)$ has a relative (or local) extrema at $x = c$, then $x = c$ is a critical point of $f(x)$.

Extreme Value Theorem

If $f(x)$ is continuous on the closed interval $[a, b]$ then there exist numbers c and d so that,

- $a \leq c, d \leq b$.
- $f(c)$ is the abs. max. in $[a, b]$.
- $f(d)$ is the abs. min. in $[a, b]$.

Finding Absolute Extrema

To find the absolute extrema of the continuous function $f(x)$ on the interval $[a, b]$ use the following process:

- Find all critical points of $f(x)$ in $[a, b]$.
- Evaluate $f(x)$ at all points found in Step 1.
- Evaluate $f(a)$ and $f(b)$.

- Identify the abs. max. (largest function value) and the abs. min. (smallest function value) from the evaluations in Steps 2 & 3.

Extrema**Relative (local) Extrema**

- $x = c$ is a relative (or local) maximum of $f(x)$ if $f(c) \geq f(x)$ for all x near c .
- $x = c$ is a relative (or local) minimum of $f(x)$ if $f(c) \leq f(x)$ for all x near c .

1st Derivative Test

If $x = c$ is a critical point of $f(x)$ then $x = c$ is

- a rel. max. of $f(x)$ if $f'(x) > 0$ to the left of $x = c$ and $f'(x) < 0$ to the right of $x = c$.
- a rel. min. of $f(x)$ if $f'(x) < 0$ to the left of $x = c$ and $f'(x) > 0$ to the right of $x = c$.
- not a relative extrema of $f(x)$ if $f'(x)$ is the same sign on both sides of $x = c$.

2nd Derivative Test

If $x = c$ is a critical point of $f(x)$ such that

$$f'(c) = 0 \text{ then } x = c$$

- is a relative maximum of $f(x)$ if $f''(c) < 0$.
- is a relative minimum of $f(x)$ if $f''(c) > 0$.
- may be a relative maximum, relative minimum, or neither if $f''(c) = 0$.

Finding Relative Extrema and/or Classify Critical Points

- Find all critical points of $f(x)$.
- Use the 1st derivative test or the 2nd derivative test on each critical point.

Mean Value Theorem

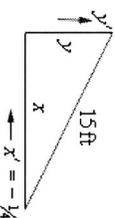

If $f(x)$ is continuous on the closed interval $[a, b]$ and differentiable on the open interval (a, b)

$$\text{then there is a number } a < c < b \text{ such that } f'(c) = \frac{f(b) - f(a)}{b - a}.$$

Related Rates

Sketch picture and identify known/unknown quantities and differentiate with respect to t using implicit differentiation (t is add on a derivative every time you differentiate a function of t). Plug in known quantities and solve for the unknown quantity.

Ex. A 15 foot ladder is resting against a wall. The bottom is initially 10 ft away and is being pushed towards the wall at $\frac{1}{4}$ ft/sec. How fast is the top moving after 12 sec?

x' is negative because x is decreasing. Using Pythagorean Theorem and differentiating,

$$x^2 + y^2 = 15^2 \Rightarrow 2x x' + 2y y' = 0$$

After 12 sec we have $x = 10 - 12(\frac{1}{4}) = 7$ and

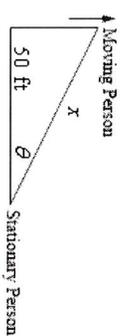

so $y = \sqrt{15^2 - 7^2} = \sqrt{176}$. Plug in and solve for y' .

$$7(-\frac{1}{4}) + \sqrt{176} y' = 0 \Rightarrow y' = \frac{7}{4\sqrt{176}} \text{ ft/sec}$$

Related Rates

Write down equation relating quantities and solve for the unknown quantity.

Ex. Two people are 50 ft apart when one starts walking north. The angle θ changes at 0.01 rad/min. At what rate is the distance between them changing when $\theta = 0.5$ rad?

We have $\theta' = 0.01$ rad/min, and want to find x' . We can use various trig funcs but easiest is,

$$\sec \theta = \frac{x}{50} \Rightarrow \sec \theta \tan \theta \theta' = \frac{x'}{50}$$

We know $\theta = 0.5$ so plug in θ' and solve.

$$\sec(0.5) \tan(0.5)(0.01) = \frac{x'}{50}$$

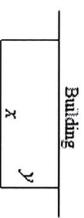

$$x' = 0.3112 \text{ ft/sec}$$

Remember to have calculator in radians!

Optimization

Sketch picture if needed, write down equation to be optimized and constraint. Solve constraint for one of the two variables and plug into first equation. Find critical points of equation in range of variables and verify that they are min/max as needed.

Ex. We're enclosing a rectangular field with 500 ft of fence material and one side of the field is a building. Determine dimensions that will maximize the enclosed area.

Maximize $A = xy$ subject to constraint of $x + 2y = 500$. Solve constraint for x and plug into area.

$$x = 500 - 2y \Rightarrow A = y(500 - 2y) = 500y - 2y^2$$

Differentiate and find critical point(s).

$$A' = 500 - 4y \Rightarrow y = 125$$

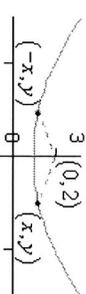

By 2nd deriv., test this is a rel. max. and so is the answer we're after. Finally, find x .

$$x = 500 - 2(125) = 250$$

The dimensions are then 250 x 125.

Solve constraint for one of the two variables and plug into first equation. Find critical points of equation in range of variables and verify that they are min/max as needed.

Ex. Determine point(s) on $y = x^2 + 1$ that are closest to $(0, 2)$.

Minimize $f = d^2 = (x - 0)^2 + (y - 2)^2$ and the constraint is $y = x^2 + 1$. Solve constraint for x^2 and plug into the function.

$$x^2 = y - 1 \Rightarrow f = x^2 + (y - 2)^2$$

$$= y - 1 + (y - 2)^2 = y^2 - 3y + 3$$

Differentiate and find critical point(s).

$$f' = 2y - 3 \Rightarrow y = \frac{3}{2}$$

By the 2nd derivative test this is a rel. min. and so all we need to do is find x value(s).

$$x^2 = \frac{3}{2} - 1 = \frac{1}{2} \Rightarrow x = \pm \frac{1}{\sqrt{2}}$$

The 2 points are then $(\frac{1}{\sqrt{2}}, \frac{3}{2})$ and $(-\frac{1}{\sqrt{2}}, \frac{3}{2})$.

Integrals**Definitions**

Definite Integral: Suppose $f(x)$ is continuous on $[a, b]$. Divide $[a, b]$ into n subintervals of width Δx and choose x_i^* from each interval.

Anti-Derivative: An anti-derivative of $f(x)$ is a function, $F(x)$, such that $F'(x) = f(x)$.

Indefinite Integral: $\int f(x) dx = F(x) + c$ where $F(x)$ is an anti-derivative of $f(x)$.

$$\text{Then } \int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x.$$

Fundamental Theorem of Calculus

Part I: If $f(x)$ is continuous on $[a, b]$ then

Variants of Part I:

$$g(x) = \int_a^x f(t) dt \text{ is also continuous on } [a, b]$$

$$\frac{d}{dx} \int_a^{u(x)} f(t) dt = u'(x) f[u(x)]$$

$$\text{and } g'(x) = \frac{d}{dx} \int_a^x f(t) dt = f(x).$$

$$\frac{d}{dx} \int_a^b f(t) dt = -v'(x) f[v(x)]$$

Part II: $f(x)$ is continuous on $[a, b]$, $F(x)$ is an anti-derivative of $f(x)$ (i.e. $F'(x) = f(x)$)

$$\frac{d}{dx} \int_a^{u(x)} f(t) dt = u'(x) f[u(x)] - v'(x) f[v(x)]$$

$$\text{then } \int_a^b f(x) dx = F(b) - F(a).$$

Properties

$$\int f(x) \pm g(x) dx = \int f(x) dx \pm \int g(x) dx$$

$$\int cf(x) dx = c \int f(x) dx, c \text{ is a constant}$$

$$\int_a^b f(x) \pm g(x) dx = \int_a^b f(x) dx \pm \int_a^b g(x) dx$$

$$\int_a^b cf(x) dx = c \int_a^b f(x) dx, c \text{ is a constant}$$

$$\int_a^a f(x) dx = 0$$

$$\int_a^b c dx = c(b-a)$$

$$\int_a^b f(x) dx = -\int_b^a f(x) dx$$

$$\left| \int_a^b f(x) dx \right| \leq \int_a^b |f(x)| dx$$

$$\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx \text{ for any value of } c.$$

If $f(x) \geq g(x)$ on $a \leq x \leq b$ then $\int_a^b f(x) dx \geq \int_a^b g(x) dx$

If $f(x) \geq 0$ on $a \leq x \leq b$ then $\int_a^b f(x) dx \geq 0$

If $m \leq f(x) \leq M$ on $a \leq x \leq b$ then $m(b-a) \leq \int_a^b f(x) dx \leq M(b-a)$

Common Integrals

$$\int k dx = kx + c$$

$$\int \cos u du = \sin u + c$$

$$\int x^n dx = \frac{1}{n+1} x^{n+1} + c, n \neq -1$$

$$\int \sin u du = -\cos u + c$$

$$\int x^{-1} dx = \int \frac{1}{x} dx = \ln|x| + c$$

$$\int \sec^2 u du = \tan u + c$$

$$\int \frac{1}{ax+b} dx = \frac{1}{a} \ln|ax+b| + c$$

$$\int \sec u \tan u du = \sec u + c$$

$$\int \ln u du = u \ln(u) - u + c$$

$$\int \csc u \cot u du = -\csc u + c$$

$$\int e^u du = e^u + c$$

$$\int \csc^2 u du = -\cot u + c$$

$$\int \tan u du = \ln|\sec u| + c$$

$$\int \sec u du = \ln|\sec u + \tan u| + c$$

$$\int \frac{1}{a^2+u^2} du = \frac{1}{a} \tan^{-1}\left(\frac{u}{a}\right) + c$$

$$\int \frac{1}{\sqrt{a^2-u^2}} du = \sin^{-1}\left(\frac{u}{a}\right) + c$$

Standard Integration Techniques

Note that at many schools all but the Substitution Rule tend to be taught in a Calculus II class.

u Substitution: The substitution $u = g(x)$ will convert $\int_a^b f(g(x)) g'(x) dx = \int_{g(a)}^{g(b)} f(u) du$ using $du = g'(x) dx$. For indefinite integrals drop the limits of integration.

$$\text{Ex. } \int_1^2 5x^2 \cos(x^3) dx = \int_1^8 \frac{1}{5} \cos(u) du = \frac{1}{5} \sin(u) \Big|_1^8 = \frac{1}{5} (\sin(8) - \sin(1))$$

$$u = x^3 \Rightarrow du = 3x^2 dx \Rightarrow x^2 dx = \frac{1}{3} du$$

$$x = 1 \Rightarrow u = 1^3 = 1 \quad \therefore x = 2 \Rightarrow u = 2^3 = 8$$

Integration by Parts: $\int u dv = uv - \int v du$ and $\int_a^b u dv = uv \Big|_a^b - \int_a^b v du$. Choose u and dv from

integral and compute du by differentiating u and compute v using $v = \int dv$.

$$\text{Ex. } \int xe^{-x} dx$$

$$u = x \quad dv = e^{-x} \Rightarrow du = dx \quad v = -e^{-x}$$

$$\int xe^{-x} dx = -xe^{-x} + \int e^{-x} dx = -xe^{-x} - e^{-x} + c$$

$$\text{Ex. } \int_3^5 \ln x dx$$

$$u = \ln x \quad dv = dx \Rightarrow du = \frac{1}{x} dx \quad v = x$$

$$\int_3^5 \ln x dx = x \ln x \Big|_3^5 - \int_3^5 dx = (x \ln(x) - x) \Big|_3^5 = 5 \ln(5) - 3 \ln(3) - 2$$

Products and (some) Quotients of Trig Functions

For $\int \sin^n x \cos^m x dx$ we have the following:

1. **n odd.** Strip 1 sine out and convert rest to cosines using $\sin^2 x = 1 - \cos^2 x$, then use the substitution $u = \cos x$.

2. **m odd.** Strip 1 cosine out and convert rest to sines using $\cos^2 x = 1 - \sin^2 x$, then use the substitution $u = \sin x$.

3. **n and m both odd.** Use either 1. or 2.

4. **n and m both even.** Use double angle and/or half angle formulas to reduce the integral into a form that can be integrated.

Trig Formulas: $\sin(2x) = 2 \sin(x) \cos(x)$, $\cos^2(x) = \frac{1}{2}(1 + \cos(2x))$, $\sin^2(x) = \frac{1}{2}(1 - \cos(2x))$

For $\int \tan^n x \sec^m x dx$ we have the following:

1. **n odd.** Strip 1 tangent and 1 secant out and convert the rest to secants using $\tan^2 x = \sec^2 x - 1$, then use the substitution $u = \sec x$.

2. **m even.** Strip 2 secants out and convert rest to tangents using $\sec^2 x = 1 + \tan^2 x$, then use the substitution $u = \tan x$.

3. **n odd and m even.** Use either 1. or 2.

4. **n even and m odd.** Each integral will be dealt with differently.

$$\text{Ex. } \int \frac{\sin^5 x}{\cos^3 x} dx$$

$$\int \frac{\sin^5 x}{\cos^3 x} dx = \int \frac{\sin^4 x \sin x}{\cos^3 x} dx = \int \frac{(\sin^2 x)^2 \sin x}{\cos^3 x} dx$$

$$= \int \frac{(1 - \cos^2 x)^2 \sin x}{\cos^3 x} dx \quad (u = \cos x)$$

$$= -\int \frac{(1 - u^2)^2}{u^3} du = -\int \frac{1 - 2u^2 + u^4}{u^3} du$$

$$= \frac{1}{2} \sec^2 x + 2 \ln|\cos x| - \frac{1}{2} \cos^2 x + c$$

$$\text{Ex. } \int \tan^3 x \sec^5 x dx$$

$$\int \tan^3 x \sec^5 x dx = \int \tan^2 x \sec^4 x \tan x \sec x dx$$

$$= \int (\sec^2 x - 1) \sec^4 x \tan x \sec x dx$$

$$= \int (u^2 - 1) u^4 du \quad (u = \sec x)$$

$$= \frac{1}{7} \sec^7 x - \frac{1}{5} \sec^5 x + c$$

Trig Substitutions : If the integral contains the following root use the given substitution and formula to convert into an integral involving trig functions.

$$\sqrt{a^2 - b^2 x^2} \Rightarrow x = \frac{a}{b} \sin \theta \quad \left| \quad \sqrt{b^2 x^2 - a^2} \Rightarrow x = \frac{a}{b} \sec \theta \quad \left| \quad \sqrt{a^2 + b^2 x^2} \Rightarrow x = \frac{a}{b} \tan \theta \right. \right.$$

$$\cos^2 \theta = 1 - \sin^2 \theta \quad \left| \quad \tan^2 \theta = \sec^2 \theta - 1 \quad \left| \quad \sec^2 \theta = 1 + \tan^2 \theta \right. \right.$$

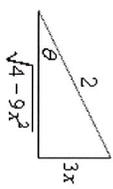

Ex. $\int \frac{16}{x^2 \sqrt{4-9x^2}} dx$ $\int \frac{16}{\frac{4}{9} \sin^2 \theta (2 \cos \theta)}$ $d\theta = \int \frac{12}{\sin^2 \theta} d\theta$

$x = \frac{2}{3} \sin \theta \Rightarrow dx = \frac{2}{3} \cos \theta d\theta$ $= \int 12 \csc^2 \theta d\theta = -12 \cot \theta + c$

$\sqrt{4-9x^2} = \sqrt{4-4\sin^2 \theta} = \sqrt{4\cos^2 \theta} = 2|\cos \theta|$

Use Right Triangle Trig to go back to x 's. From substitution we have $\sin \theta = \frac{3x}{2}$ so,

Recall $\sqrt{x^2} = |x|$. Because we have an indefinite integral we'll assume positive and drop absolute value bars. If we had a definite integral we'd need to compute θ 's and remove absolute value bars based on that and.

$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$ From this we see that $\cot \theta = \frac{\sqrt{4-9x^2}}{3x}$. So,

In this case we have $\sqrt{4-9x^2} = 2 \cos \theta$. $\int \frac{16}{x^2 \sqrt{4-9x^2}} dx = -\frac{4\sqrt{4-9x^2}}{x} + c$

Partial Fractions : If integrating $\int \frac{P(x)}{Q(x)} dx$ where the degree of $P(x)$ is smaller than the degree of

$Q(x)$. Factor denominator as completely as possible and find the partial fraction decomposition of the rational expression. Integrate the partial fraction decomposition (P.F.D.). For each factor in the denominator we get term(s) in the decomposition according to the following table.

Factor in $Q(x)$	Term in P.F.D	Factor in $Q(x)$	Term in P.F.D
$ax + b$	$\frac{A}{ax + b}$	$(ax + b)^k$	$\frac{A_1}{ax + b} + \frac{A_2}{(ax + b)^2} + \dots + \frac{A_k}{(ax + b)^k}$
$ax^2 + bx + c$	$\frac{Ax + B}{ax^2 + bx + c}$	$(ax^2 + bx + c)^k$	$\frac{A_1 x + B_1}{ax^2 + bx + c} + \dots + \frac{A_k x + B_k}{(ax^2 + bx + c)^k}$

Ex. $\int \frac{7x^2 + 13x}{(x-1)(x^2+4)} dx$ $\frac{7x^2 + 13x}{(x-1)(x^2+4)} = \frac{A}{x-1} + \frac{Bx+C}{x^2+4}$

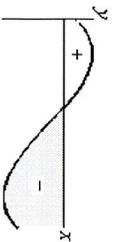

$\int \frac{7x^2 + 13x}{(x-1)(x^2+4)} dx = \int \frac{4}{x-1} + \frac{3x+16}{x^2+4} dx$
 $= \int \frac{4}{x-1} + \frac{3x}{x^2+4} + \frac{16}{x^2+4} dx$
 $= 4 \ln|x-1| + \frac{3}{2} \ln|x^2+4| + 8 \tan^{-1}(\frac{x}{2})$

Here is partial fraction form and recombined.
 $A = 4$ $C - B = 13$ $4A - C = 0$
 $A + B = 7$ $B = 3$ $C = 16$

An alternate method that *sometimes* works to find constants. Start with setting numerators equal in previous example : $7x^2 + 13x = A(x^2 + 4) + (Bx + C)(x - 1)$. Choose *nice* values of x and plug in. For example if $x = 1$ we get $20 = 5A$ which gives $A = 4$. This won't always work easily.

Applications of Integrals

Net Area : $\int_a^b f(x) dx$ represents the net area between $f(x)$ and the x -axis with area above x -axis positive and area below x -axis negative.

Area Between Curves : The general formulas for the two main cases for each are,

$y = f(x) \Rightarrow A = \int_a^b |\text{upper function}| - |\text{lower function}| dx$ & $x = f(y) \Rightarrow A = \int_c^d |\text{right function}| - |\text{left function}| dy$

If the curves intersect then the area of each portion must be found individually. Here are some sketches of a couple possible situations and formulas for a couple of possible cases.

$A = \int_a^b f(x) - g(x) dx$

$A = \int_c^d f(y) - g(y) dy$

$A = \int_c^b f(x) - g(x) dx + \int_c^b g(x) - f(x) dx$

Volumes of Revolution : The two main formulas are $V = \int A(x) dx$ and $V = \int A(y) dy$. Here is some general information about each method of computing and some examples.

Rings (Washer)
 $A = \pi \left((\text{outer radius})^2 - (\text{inner radius})^2 \right)$

*** Cylinders**
 $A = 2\pi (\text{radius}) (\text{width / height})$

Limits: xy of right/bot ring to xy of left/top ring Horz. Axis use $f(x)$, Vert. Axis use $f(y)$, $g(x), A(x)$ and dx .	$g(y), A(y)$ and dy .	Limits: xy of inner cyl. to xy of outer cyl. Horz. Axis use $f(y)$, Vert. Axis use $f(x)$, $g(y), A(y)$ and dy .	$g(x), A(x)$ and dx .
---	-------------------------	--	-------------------------

Ex. Axis : $y = a > 0$	Ex. Axis : $y = a \leq 0$	Ex. Axis : $y = a > 0$	Ex. Axis : $y = a \leq 0$

These are only a few cases for horizontal axis of rotation. If axis of rotation is the x -axis use the $y = a \leq 0$ case with $a = 0$. For vertical axis of rotation ($x = a > 0$ and $x = a \leq 0$) interchange x and y to get appropriate formulas.
